

Katsukity DSi Capture Card

Used the Nisetro system - this also seems to be used on their 3DS cards, but they claim it was used on their DS cards too. The DS cards they sold were the Loopy ones, so it's probably just a branding thing, and they have somewhat different internals (Probably developed by optimize)

Cameron USB FX2 - USB FPGA chip, I think it's now known as Chameleon USB FX2 JUNFLON Wiring??

Appears that the FPGA was builtin to the case.

Used a mini USB cable - they sold a 1.8m long one

Sold the install kit for \$185 USD, claimed that retail price was \$285

Sold a pre-modded DSi for \$310, claimed that retail price was \$480

From their stock numbers on the website, it seems like they sold at least a few thousand of them

Software and installation manual sent to the user via email, so there aren't any public images of the internals - let me know if you find any

Didn't natively do audio (they sold a 3.5mm cable, so they expected people to use that and plug it into a mic port)

Stopped selling them between August 31 and October 2nd, 2016 (Wayback machine shows an error 404 on October 2nd)

According to DSJ pretty much all of the pics are of prototypes

Can't find a photo of the internals of the card
